

Northern Line 1995 tube Vibration testing

The 1995 tube stock vehicles are operated on the Northern Line Underground from Golders Green depot and were originally supplied by ALSTOM Transport (Metro Cammell), Birmingham.

The driver's seat in these units is about to undergo a replacement programme and in June 2006 TestPRO limited was asked by Tube Lines the company responsibility for the maintenance and upgrade of all the infrastructure on the Northern Line to carry out a track test measurements of the accelerations experienced by the seat.

The object of testing was to determine the levels of acceleration in three axes at floor and seat level over a typical service route with the seat in both occupied and unoccupied conditions.

TestPRO Limited is delighted to have supported this project by providing a cost effective testing service.
